add employer name in party domain for customer KYC

09:51

 Business Analyst

Thanks for the request. Could you help me understand the core business problem? What specific pain point or requirement is driving the need to add employer name to the party domain for KYC?

09:51

onboarding is delayed due to incomplete data

09:59

 Business Analyst

Thank you for the context. You mentioned onboarding is delayed due to incomplete data. Could you tell me who are the key stakeholders impacted by this delay—for example, which teams or roles are involved in the onboarding process?

09:59

middle office team need to wait for complete data set

10:00

 Business Analyst

Thanks for clarifying. Now, what would "done" look like for you? For instance, what measurable outcome would indicate this request is successful—like a specific reduction in onboarding time or achieving 100% data completeness for employer details?

10:00

reduction in the number of incomplete data cases

10:39

 Business Analyst

Thank you for sharing that success criterion. Let me now understand the scope a bit better — when you say "add employer name in party domain," does this apply only to new customer onboarding, or would it also include updating existing customer records?

10:39

 Product Owner

Thanks for that clarification. You're looking to reduce incomplete data cases during onboarding. Can you help me understand the measurable business outcome tied to that

reduction? For example, does it translate directly into faster time-to-revenue, lower operational costs, reduced compliance risk, or higher customer satisfaction?

10:39

lower operational costs

10:39

 Business Analyst

Thanks for noting that—reducing incomplete data cases ties directly to lower operational costs, which is a strong success metric. To help clarify the scope: does the need to add employer name apply only to new customer onboarding, or would you also need to populate it for existing customer records where it's currently missing?

10:39

 Product Owner

That makes sense — lower operational costs are a strong driver. Could you connect this initiative to any specific company OKR or strategic objective for this quarter or year? For example, is there a goal like "Reduce operational expenses by 10%" or "Streamline onboarding to under 2 days" that this work supports?

Title

Add Employer Name Field to Party Domain for KYC Onboarding

Business Problem

Customer onboarding is delayed due to incomplete data – specifically, the employer name field is missing from the party domain. This causes the middle office team to wait for a complete data set, increasing operational costs and slowing down the onboarding process.

Customer Impact

New customers will experience faster onboarding with fewer data validation delays. Existing customers may see improved data consistency if backfilling is performed.

Stakeholders

Middle Office TeamOperationsComplianceCustomer Support

 Success Metrics

Reduction in the number of incomplete data cases reported during onboarding by at least 80% within three months of deployment. Corresponding reduction in operational costs measured by decreased manual touchpoints.

 Expected ROI

Lower operational costs by reducing manual rework and follow-ups caused by incomplete data cases. Faster onboarding cycles will also improve customer experience and time-to-revenue.

 Non-Functional Requirements

- performance: The new field should be indexed and queried efficiently to avoid degradation of party lookup performance.
- scalability: System must handle the addition of employer name to millions of existing and new party records without downtime.
- security: Employer name is considered PII and must be encrypted at rest and in transit. Access must be role-based with audit logging.
- compliance: KYC regulations (e.g., AML, Customer Due Diligence) require employer information; must meet regulatory standards for data capture and storage.
- availability: Changes must be deployed with zero downtime; rollback plan required.

 Dependencies

Party domain database schema changeAPI layer update for party CRUDFront-end UI changes for onboarding formsKYC validation pipeline updateExisting record backfill process (if scope includes existing customers)

 Constraints

- Scope for existing customer records not confirmed – needs clarification
- Employer name must be validated against a defined format/length
- Must align with existing KYC data model and data governance policies

- AML KYC regulations (e.g., Bank Secrecy Act, FATF recommendations)
- PII handling under GDPR/CRA (if applicable)
- Audit trail for data changes as per SOX/internal policies

- Scope creep if existing record backfill is required without clear success criteria
- Data quality issues for employer name (e.g., free-text, misspellings) requiring validation rules
- Integration with legacy systems may require additional middleware

Urgency: High

Domain: Customer Data & KYC
